

Core Connection:

The strategic advantage of data-enabled core banking

Data is an incredibly powerful tool for financial services. When gathered and applied correctly, it can drive strategic decision-making, unlock new opportunities, and uncover insights that can dramatically improve almost every area of business.

When a bank or credit union can identify patterns and anticipate market shifts through data, it can stay competitive and profitable.

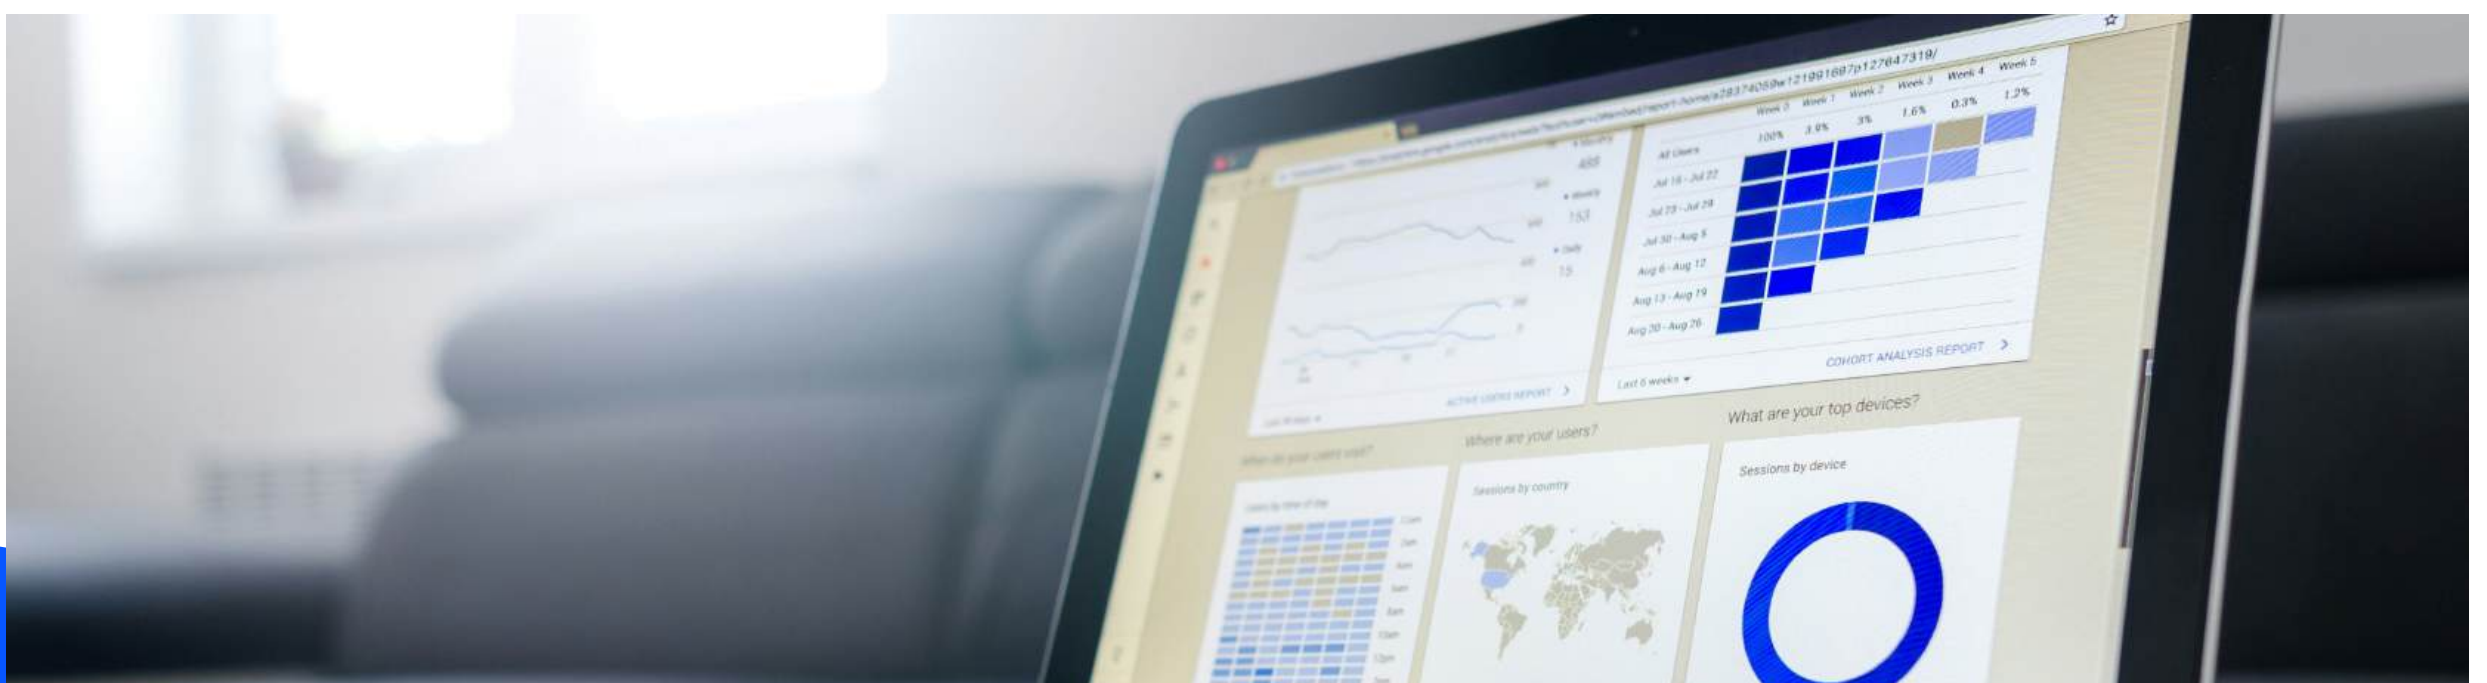

However, accessing, managing, and using data effectively can be challenging for many financial institutions. Here are just a few of the considerations financial institutions should keep in mind in their data journey:

- Industry challenges like competition from larger banks and fintechs and regulatory changes
- Technological roadblocks from legacy systems that complicate data integrations, accessibility, real-time analytics capabilities, and overall cost implications
- Areas for improvement in operations related to tracking, data-driven decision-making, managing vendors, and dealing with fraud attempts, etc.
- Exciting spaces for growth when creating and implementing a data strategy

In this considerable list of challenges and opportunities, there is a solution for financial institutions that want to harness data insights for success. Nymbus Connect, our data integration and insights platform, is designed specifically for your bank or credit union's data and integration needs. We want to help financial institutions deepen their understanding of their customer needs, optimize operations, and enhance risk management strategies. We are dedicated to advancing progress and facilitating seamless integration. Nymbus Connect ensures complete interoperability with banking cores, enabling banks to effortlessly integrate third-party solutions and leverage their data for event-driven use cases.

Nymbus Connect is flexible, offering five different ways to connect to your Nymbus Core data, depending on your financial institution's needs and where you are in your banking journey.

The magic of our software is that you only use the parts you need. If you already have an existing data system like a data warehouse or a preferred analytics platform, you can easily integrate them into Nymbus Connect to access all the data in Nymbus Core and maximize your investments.

Strategy, Supercharged

Interoperability and real-time data access are critical driving forces behind all modernization efforts. Together, they help meet the growing customer expectations for instant and on-the-go banking services and financial institutions' needs to stay on top of operations, compliance, and risks like fraud. A forward-thinking data strategy that's aligned with your core banking strategy will help you:

- Make data-driven decisions
- Enhance customer experience
- Maintain regulatory compliance
- Boost operational efficiency
- Achieve future readiness

Ideal Integration

Getting data out of the core and bringing in new third-party services can be difficult for financial institutions operating on legacy cores. Integrating new partners into the core or accessing data may involve long vetting processes, agreement to specific terms, partner APIs with rate limits or limited access, subscription plans, or other financial commitments. We've made it easy to integrate with us. Our APIs are purpose-built for external consumption; they're well-organized and documented. Client and Partner developers can access the Nymbus Connect Developer Portal to view the latest API specifications and test APIs against a sandbox environment.

Easy Access

Nymbus Connect features a data lake and warehouse, providing financial institutions with comprehensive access to their data. While both systems are designed to aggregate, store, and process vast amounts of data, the data lake accommodates structured and unstructured data, enhancing flexibility and data utility. At the same time, the data warehouse is optimized for business intelligence use. There are a number of benefits to this approach:

- Access to all your data without impacting core operations: your core data isn't siloed in multiple; it remains fully accessible to your institution for any reporting or advanced analytics you want.
- Enable new technologies like chatbots and machine learning: organizing data into a manageable data lake makes integrating machine learning tools or chatbots easy.
- Get all the core data you need to run advanced analytics: historical trend analysis and predictive modeling require data from multiple sources, as well as real-time data processing and advanced analytics.
- Your choice of BI tools: Nymbus is analytics-platform agnostic. We offer a centralized data repository for analytics and business intelligence, which you can easily plug into your preferred analytics platform.

Smooth Streaming

Our approach to streaming data is comprehensive and real-time. It goes beyond what's typically considered industry-standard Kafka streaming. It's not tailored to the job and structured for client consumption. Every data change in the core is streamed out, allowing banks to act and react to specific account changes, transactions, or other alterations to the core to create real-time notifications, updates, and customer interactions.

Just a few of the ways a streaming core can make many areas of business easier are:

- Sending event data to third party monitoring services for regulatory, compliance and security
- Filling your enterprise data lake or data warehouse to make analytics more efficient
- More robust data access for marketing teams targeting offers based on activities and events.

Robust Reporting

Nymbus Connect's reporting engine offers a suite of standard reports that are immediately available out of the box. It also automates the creation of reports, facilitating easy access to standard analytics and enabling the development of new data visualizations and data extracts as needed. The system was built to work seamlessly with Connect's bank-facing platforms, allowing employees with the appropriate permissions to access the reports they need for their roles, complete with any required configurations, data aggregation, or cleansing.

Safe and Secure

We understand the paramount importance of Data Security and Data Governance for our banking clients. By leveraging the largest public cloud infrastructure, we ensure our clients can securely and effectively manage their data across various platforms. This safeguards sensitive information and enables banks and credit unions to unlock the full potential of their data, driving insightful business decisions and fostering innovation.

Looking to Tomorrow

It's no secret that community banks and credit unions today face many data-related challenges, ranging from operational inefficiencies and technological constraints to industry pressures and organizational hurdles. Nymbus Connect addresses these challenges by offering a comprehensive data and connectivity platform that delivers data governance, security, and system resilience. It's designed to meet you where you are in your data journey to enable your vision, your way.
